If the task force is secret, I won't comment on whether I am involved or not (I don't discuss relationships with clients or potential clients).

However, I am happy to say what I would advise this task force or anyone else: make the moral case for fossil fuels. That is, frame the climate influence of CO2 as part of the overall impact of fossil fuels on human flourishing--not as a standalone issue. Talking about "climate change" as a standalone issue without discussing the unique benefits of fossil fuels is as constructive and honest as talking about the side effects of prescription drugs without discussing their benefits.

Additionally, the task force should demand the precision and clarity that is so absent from this debate, which uses "climate change" as a manipulative equivocation between the demonstrated mild warming influence of CO2 and a wildly speculated warming influence of CO2.
